## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1, and 3-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Goyal et al. (US 6,751,473) in view of Borngraber et al. (US 7,215,881).

Referring to Claim 1, Goyal teaches a portable wireless terminal comprising:

A first housing having an upper end curved in a semicircular shape (see semicircular shape of ends in figs. 1 and 2), and open lower end (see 49 in fig. 14), and a receiving space defined therein and extended inwardly from the open lower end in the longitudinal direction thereof (see sliding mechanism of fig. 14); and

A second housing capable of being inserted into and drawn out from the receiving space of the first housing (see 3 of fig. 14).

Goyal does not teach a slit circumferentially formed along the upper end and a camera lens unit mounted in the first housing, the camera lens unit having an exposure window circumferentially movable along the slit formed at the upper end of the first housing. Borngraber teaches a slit circumferentially formed along the upper end (see 37 of fig. 3) and a camera lens unit mounted in the first housing (see 34 of fig. 3), the camera lens unit having an exposure window circumferentially movable along the slit formed at the upper end of the first housing (see col. 6, lines 5-11). Therefore, it would

Application/Control Number: 10/804,535

Art Unit: 2618

have been obvious to one of ordinary skill in the art at the time the invention was made to provide the teachings of Borngraber to said terminal of Goyal in order to expand the range of mobile camera phones.

Referring to Claim 8, Goyal teaches a portable wireless terminal comprising:

A housing having one end curved in a semicircular shape shape (see semicircular shape of ends in figs. 1 and 2).

Goyal does not teach a slit circumferentially formed along the semicircular end and a camera lens unit mounted in the first housing, the camera lens unit having an exposure window circumferentially movable along the slit formed at the semicircular end of the first housing. Borngraber teaches a slit circumferentially formed along the semicircular end (see 37 of fig. 3) and a camera lens unit mounted in the first housing (see 34 of fig. 3), the camera lens unit having an exposure window circumferentially movable along the slit formed at the semicircular end of the first housing (see col. 6, lines 5-11). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide the teachings of Borngraber to said terminal of Goyal in order to expand the range of mobile camera phones.

Referring to Claim 3, Borngraber also teaches a display unit arranged on a top surface of the first housing for displaying pictures (see 22 of fig. 1).

Referring to Claim 4, a keypad arranged on a top surface of the second housing, the keypad including a plurality of key buttons, wherein the keypad is hidden and exposed when the second housing is inserted into and drawn out from the receiving space of the first housing, respectively (see fig. 16).

Application/Control Number: 10/804,535

Art Unit: 2618

Referring to Claim 5, Goyal also teaches the second housing having a lower end curved in a semicircular shape (see semicircular shape of ends in figs. 1 and 2).

Referring to Claim 6, Goyal also teaches a navigation key arranged on a top surface of the second housing near the semicircular lower end of the second housing (see col. 3, lines 42-47).

Referring to Claim 7, Goyal also teaches the navigation key always exposed irrespective of whether the second housing is inserted into or drawn out from the first housing (see col. 3, lines 42-47).

Referring to Claim 9, Borngraber also teaches a slip ring capable of being slidably rotated, while being in contact with an inner part of the semicircular end of the housing (see col. 5, lines 49-55);

an exposure opening penetrated from an outer circumferential surface of the slip ring to an inner circumferential surface of the slip ring (see col. 5, lines 49-55);

a camera lens having an exposure window fixedly fitted in the exposure opening of the exposure opening (see col. 5, lines 56-61); and

a flexible printed circuit inwardly extended from the camera lens through a gap between a lower end of the slip ring and an inner bottom surface of the housing (see col. 5, lines 56-61).

3. Claims 2, 10, and 11, are rejected under 35 U.S.C. 103(a) as being unpatentable over Goyal and Borngraber and further in view of Park (US 6,704,586).

Referring to Claim 2, the combination of Goyal and Borngraber does not teach the exposure window of the camera lens unit rotated in a range of 180 degrees. Park teaches the exposure window of the camera lens unit rotated in a range of 180 degrees (see col. 4, lines 30-45). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide the teachings of Park to the modified terminal of Goyal and Borngraber in order to increase the user friendlieness of cellular phones with camera features.

Referring to Claim 10, the combination of Goyal and Borngraber does not teach the slit circumferentially formed along the semicircular end of the housing in a range of 180 degrees. Park teaches the slit circumferentially formed along the semicircular end of the housing in a range of 180 degrees (see col. 4, lines 30-45). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide the teachings of Park to the modified terminal of Goyal and Borngraber in order to increase the user friendlieness of cellular phones with camera features.

Referring to Claim 11, Park also teaches the camera lens rotated in a range of 180 degrees (see col. 4, lines 30-45).

## Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Eugene Yun whose telephone number is (571) 272-7860. The examiner can normally be reached on 9:00am-6:00pm.

Application/Control Number: 10/804,535

Art Unit: 2618

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew D. Anderson can be reached on (571)272-4177. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
